

Wayfinder

Clear paths to public services

A browser guide for citizens.

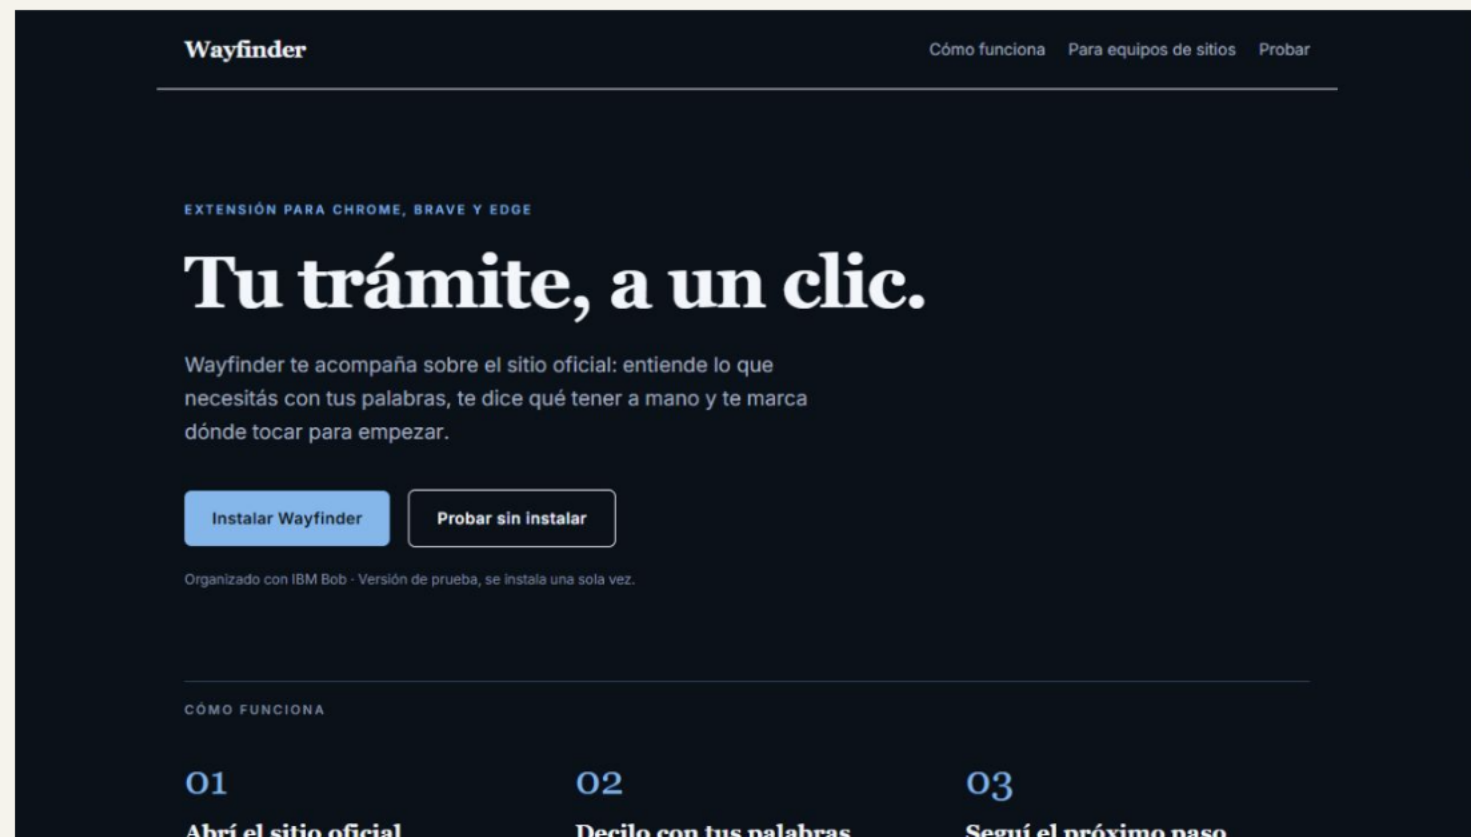

A catalog maintenance workflow built with IBM Bob.

The maintenance problem

**The citizen searches.
The team repeats the
work.**

Requirements and entry points
are scattered across pages.

Teams must collect evidence,
check changes and repair
navigation.

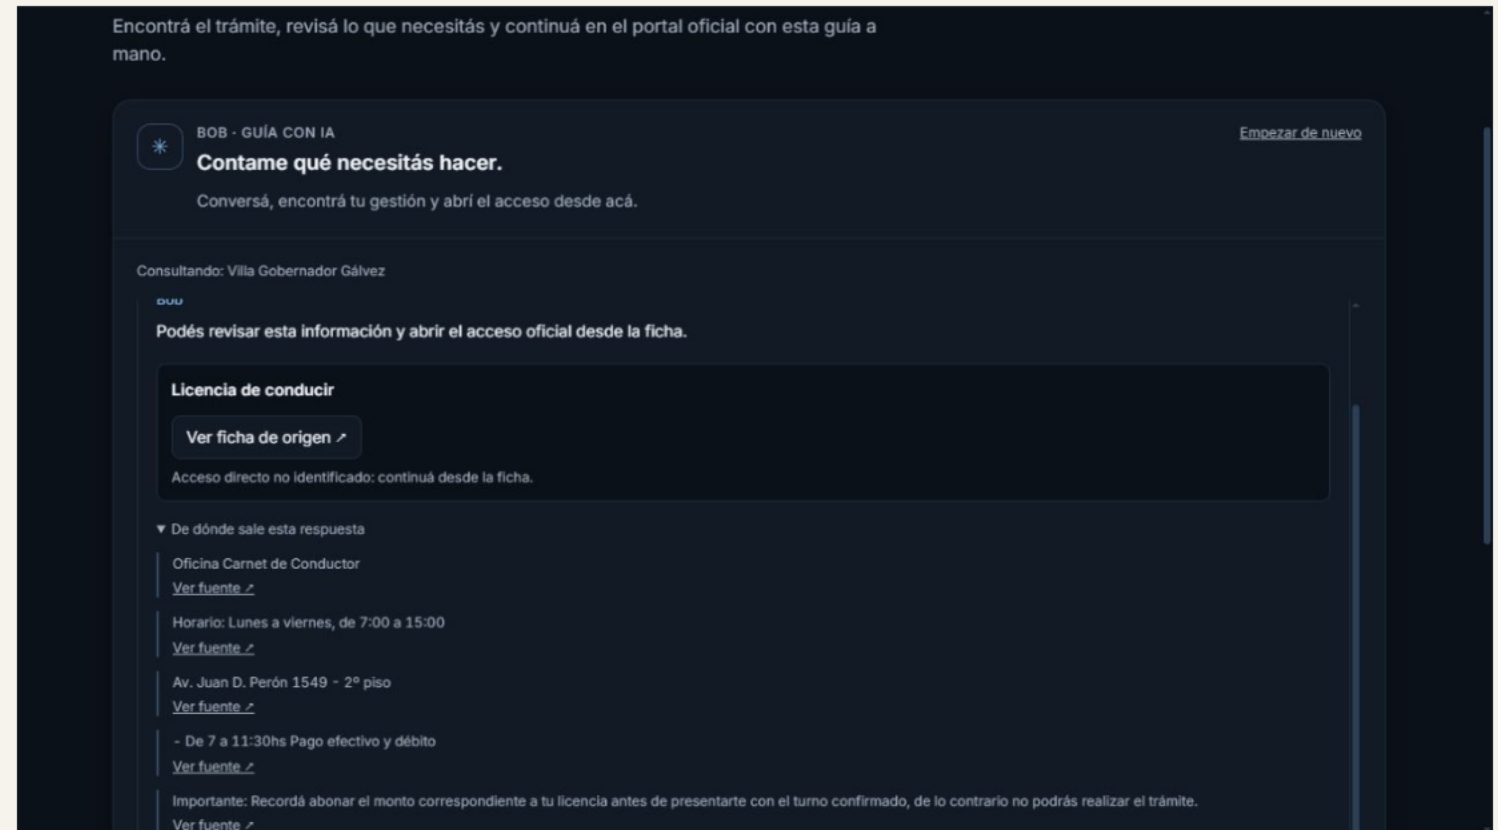

Current public prototype. Coverage is limited to the pages read.

A citizen's next step

Ask in everyday language.
Keep the official source.

Find a procedure and inspect its evidence.

Open the official entry point, or the source page when no direct link was identified.

Live VGG web demo. The citizen completes the procedure on the official site.

The site team's workflow

A catalog that can be audited and maintained

Read public pages and retain source blocks.

Organize records with bounded Bob tasks.

Review the records, compare changes and export an A–Z index.

Custom IDE modes and skills are included. The MCP service exposes six read-only tools.

What IBM Bob actually does

Runtime work, with inspectable evidence

Bob Shell organizes catalogs and guides queries.

Server validation checks block IDs, links and cited numbers.

IDE assets provide coordinator, cartographer and reviewer modes.

Measured results

Instant search, without a model call

Top-1 retrieval accuracy

92 synthetic Spanish queries
3,512 public records

Same jurisdiction filter

Synthetic queries, 3,512 documents. Controlled fixture: first results 3.4 s, full catalog 10.4 s with simulated Bob.

Granite research

A separate retrieval experiment

3,750 public procedure records.
English and Spanish training examples.

We kept the previous candidate when further training failed to improve validation.

Not deployed. Latest contrast experiment: 270/343 to 268/343 on the same synthetic validation set.

A working prototype to try

Less searching for citizens.

A clearer maintenance task for teams.
